All rights reserved, also for the translation.

None of this document may be reproduced or processed, duplicated or distributed by electronic systems in any form (print, photocopy, microfilm or any other process) without the written permission of Eaton Automation AG, St. Gallen.

Subject to modifications.

Proper use

Hardware, software, operating systems and drivers must only be used for the applications specified and only in conjunction with the components recommended by Eaton Automation AG.

Warning!

No warranty claims will be recognised for faults arising from the improper handling of devices and modules.

The devices, even by means of communication, should not be used for the implementation of any safety functions relating to the protection of personnel and machinery.

No liability is accepted for claims for damages arising from a failure or functional defect in the device.

All data specified in this document does not represent warranted properties in the legal sense.

1 GENERAL

This documentation describes the connection of a MICRO PANEL to any PLC supporting the Modbus RTU protocol.

With this communication protocol, MICRO PANEL is the master and the PLC is the slave. Communication is always initiated by the MICRO PANEL and the PLC responds according to the request.

The Modbus RTU protocol uses station addresses (STx) for communication. This enables both "point-to-point" and "multi-point" connections to be used provided that the appropriate physical interface is implemented (see figure).

Note:

The Modbus RTU protocol is also available for the SYSTEM PORT of the MICRO PANEL. This is a non-isolated RS232 interface.

It also allows you to connect a standard PC via COM(x) and implement communication with GALIEOOPEN (GALILEO runtime system for PC).

Note:

Modbus RTU communication is only supported in the described form from GALILEO V 5.00. If possible always use the latest release.

Refer to the Galileo documentation or the Online Help for more information on Galileo and GRS.

Note:

The dialogs shown from GALILEO are from Version 7.1.4.

1 General

Refer also to your MICRO PANEL user manual for further information on connection, commissioning and operating the RS232 (SYSTEM PORT) interface.

Further additional documentation:

- "User Manual Communication module MPB1-TP / MPB2-TP" Doc. no. MN04802030Z

1.1 SUPPORTED DATA TYPES

All configurable data types from GALILEO are supported.

2 MODBUS RTU IMPLEMENTATION

The Modbus RTU protocol is the intellectual property of MODICON. The protocol description is not part of this documentation and also cannot be obtained from Eaton Automation.

The MICRO PANELS have the master function in the Modbus RTU protocol. The PLC itself cannot actively initiate communication on its own, but can only respond to the requests of the master.

2.1 ADDRESSING

The protocol contains function codes that are used for the different data areas.

For Modbus RTU communication, the MICRO PANELS support the following function codes and associated data areas.

| Modbus register | GALILEO | Function code | | Data type | Granularity |
|-----------------|---------|---------------|-------|-----------|-------------|
| | | Read | Write | | |
| Coils | M | 0x01 | 0x0F | Bit | 16 Bit |
| Discrete inputs | MI | 0x02 | - | Bit | 16 Bit |
| Input registers | RI | 0x04 | - | Word | 16 Bit |
| Registers | R | 0x03 | 0x10 | Word | 16 Bit |

| GALILEO | | Modbus | | PLC | | Modbus | | GALILEO |
|---------|---|--------|---|------------------|---|--------|---|---------|
| M | → | 0x0F | → | Bit (read/write) | → | 0x01 | → | M |
| MI | | | | Bit (read/write) | → | 0x02 | → | MI |
| RI | | | | Word (read only) | → | 0x04 | → | RI |
| R | → | 0x10 | → | Word (read only) | → | 0x03 | → | R |

Note:

Refer to your PLC documentation or the PLC specific instructions from chapter 8 for where this data is referenced in the PLC.

2 Modbus RTU Implementation

2.2 DATA INTERPRETER

In accordance with the original Modbus RTU specification, the data field within the protocol is interpreted "Big Endian". A lot of devices in the field don't interpret the data field this way. Therefore it is also possible to set different modes. The setting for this parameter is described under "PLC Selection" in the section "Creating GALILEO Projects".

The following table shows how the two modes determine the interpretation of the data stream according to the data type.

| Data byte | GALILEO | Little Endian | Big Endian | Little Endian Twisted | BigEndian Twisted |
|-----------|--------------------------|---------------|--------------|-----------------------|-------------------|
| 00 | Byte A | Byte A | Byte A | Byte B | Byte B |
| 01 | Byte B | Byte B | Byte B | Byte A | Byte A |
| 02 | DWord | DWord[0] LSB | DWord[3] MSB | DWord[1] | DWord[2] |
| 03 | | DWord[1] | DWord[2] | DWord[0] LSB | DWord[3] MSB |
| 04 | | DWord[2] | DWord[1] | DWord[3] MSB | DWord[0] LSB |
| 05 | | DWord[3] MSB | DWord[0] LSB | DWord[2] | DWord[1] |
| 06 | Word | Word LSB | Word MSB | Word MSB | Word LSB |
| 07 | | Word MSB | Word LSB | Word LSB | Word MSB |
| 08 | Byte C | Byte C | Byte C | Byte D | Byte D |
| 09 | Byte D | Byte D | Byte D | Byte C | Byte C |
| 10 | Bit[32] | Bit 0..7 | Bit 0..7 | Bit 8..15 | Bit 8..15 |
| 11 | | Bit 8..15 | Bit 8..15 | Bit 0..7 | Bit 0..7 |
| 12 | | Bit 16..23 | Bit 16..23 | Bit 24...31 | Bit 24...31 |
| 13 | | Bit 24...31 | Bit 24...31 | Bit 16..23 | Bit 16..23 |
| 14 | CharArray[6] (String) | CharArray[0] | CharArray[0] | CharArray[1] | CharArray[1] |
| 15 | | CharArray[1] | CharArray[1] | CharArray[0] | CharArray[0] |
| 16 | | CharArray[2] | CharArray[2] | CharArray[3] | CharArray[3] |
| 17 | | CharArray[3] | CharArray[3] | CharArray[2] | CharArray[2] |
| 18 | | CharArray[4] | CharArray[4] | CharArray[5] | CharArray[5] |
| 19 | | CharArray[5] | CharArray[5] | CharArray[4] | CharArray[4] |

Note:

In compliance with the specification, the Modbus RTU register always contains 16-bit values. A 32-bit value (double word or float) is therefore assigned to 2 registers.

3 CABLE ASSEMBLY

General instructions concerning cable assembly, cutting to length and shielding are provided in the additional documentation stated in the section "General".

Note:

The physical interface of the MPB1(2)-TP can be configured with jumpers. For more information on this refer to the documentation of the communication card (section "General").

3.1 SYSTEM PORT AND PC COM(x) VARIANTS

DSUB 9pole female

DSUB 9pole female-

| MICRO PANEL SYSTEM PORT | | RS232 | Various | |
|----------------------------|--------|-------|---------|------|
| PIN | SIG | | SIG | PIN |
| 2 | RxD | | TxD | 3 |
| 3 | TxD | | RxD | 2 |
| 5 | 0V | | 0V | 5 |
| CASE | SHIELD | | SHIELD | CASE |

| PC COM(x) | | RS232 | Various | |
|--------------|--------|-------|---------|------|
| PIN | SIG | | SIG | PIN |
| 2 | RxD | | TxD | 3 |
| 3 | TxD | | RxD | 2 |
| 5 | 0V | | 0V | 5 |
| CASE | SHIELD | | SHIELD | CASE |

The interface on the MICRO PANEL is **not** isolated, which is also the case for most PCs. Use a cable as shown in the figure or a standard zero modem cable.

3.2 MPB1(2) – RS232 VARIANT

DSUB 9pole male

| MPB1/MPB2 COM PORT | | RS232 | Various | |
|-----------------------|--------|-------|---------|-----|
| PIN | SIG | | SIG | PIN |
| 2 | RxD | | TxD | |
| 3 | TxD | | RxD | |
| 5 | 0V | | 0V | |
| CASE | SHIELD | | SHIELD | |

The RS232 interface of the MPB1(2) is isolated.

3 Cable Assembly

3.3 MPB1(2) – RS485 VARIANT

DSUB 9pole male

| MPB1/MPB2 COM PORT | | RS232 | Various | |
|-----------------------|--------|-------|---------|-----|
| PIN | SIG | | SIG | PIN |
| 3 | A | | A | |
| 7 | B | | B | |
| 5 | 0V | | 0V | |
| CASE | SHIELD | | SHIELD | |

The RS485 interface of the MPB1(2) is isolated.

3.4 MPB1(2) – RS422 VARIANT

DSUB 9pole male

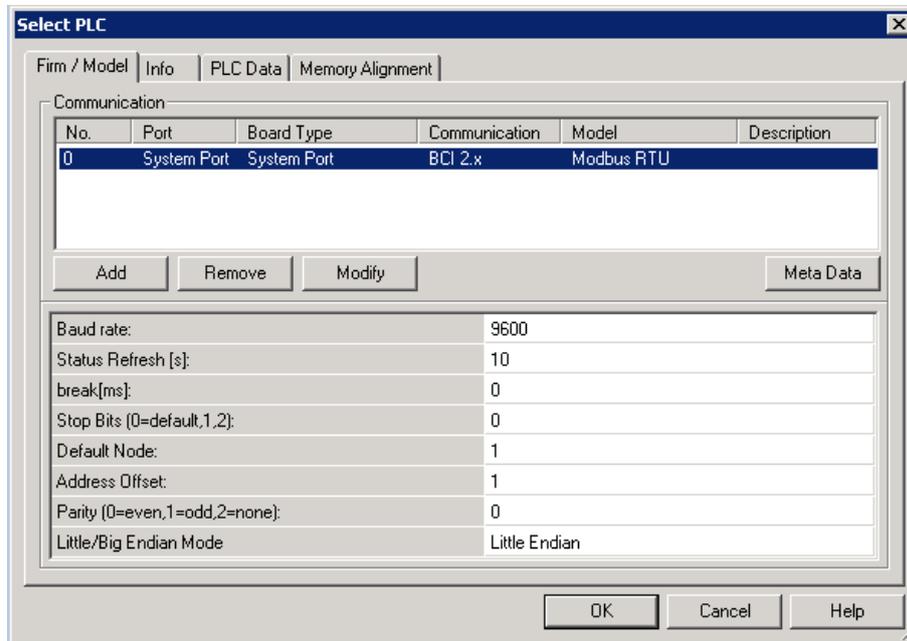

| MPB1/MPB2 COM PORT | | RS232 | Various | |
|-----------------------|--------|-------|---------|-----|
| PIN | SIG | | SIG | PIN |
| 2 | TX+ | | RX+ | |
| 3 | RX+ | | TX+ | |
| 5 | 0V | | 0V | |
| 7 | TX- | | RX- | |
| 8 | RX- | | TX- | |
| CASE | SHIELD | | SHIELD | |

The RS422 interface of the MPB1(2) is isolated.

4 CREATING GALILEO PROJECTS

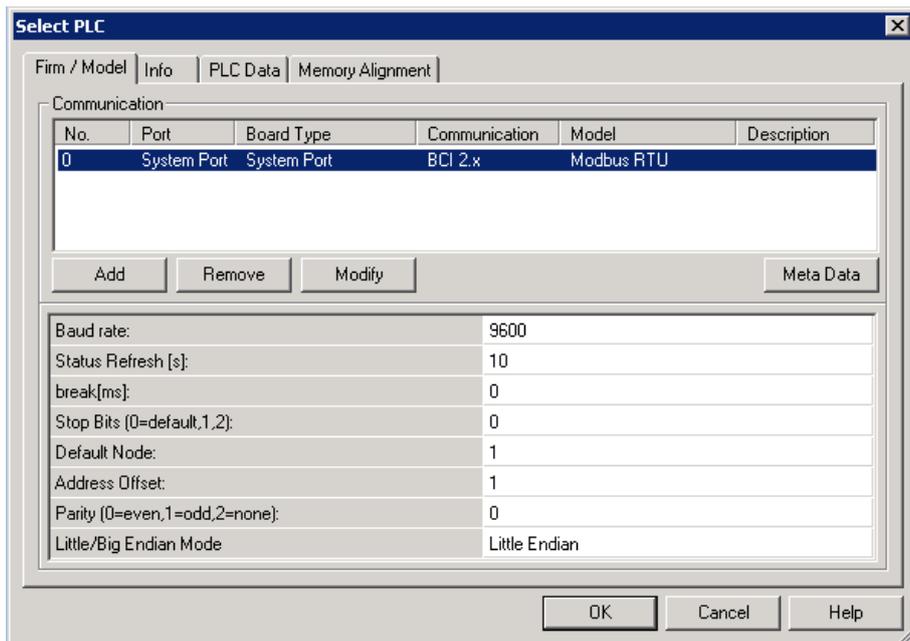

Start GALILEO and create a new project suitable for your MICRO PANEL.

In the Select PLC dialog, select for Port and Type "SYSTEM PORT", "Modbus RTU" for MPB1(2)-TP or "Modbus TCP" for communication via Ethernet as shown in the figure.

| Communication | RTU | MPB | TCP | | | | | | | | |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|----------|------|---|-----|---|------|---|---|---|---|
| "Baud rate" Select one of the baud rates provided for selection and suitable for your PLC. | ✓ | ✓ | ✗ | | | | | | | | |
| "Status Refresh [s]" Refer to the GALILEO documentation for a description of this parameter. | ✓ | ✓ | ✓ | | | | | | | | |
| "Pause [ms]" This can be used to define a pause that will occur after an active data exchange with the PLC. | ✓ | ✓ | ✓ | | | | | | | | |
| "Stopbits (0=standard, 1, 2)" Select the Stopbits suitable for your PLC. | | | | | | | | | | | |
| <table border="1"> <thead> <tr> <th>Parity</th> <th>stop bit</th> </tr> </thead> <tbody> <tr> <td>even</td> <td>1</td> </tr> <tr> <td>odd</td> <td>1</td> </tr> <tr> <td>none</td> <td>2</td> </tr> </tbody> </table> | Parity | stop bit | even | 1 | odd | 1 | none | 2 | ✓ | ✗ | ✗ |
| Parity | stop bit | | | | | | | | | | |
| even | 1 | | | | | | | | | | |
| odd | 1 | | | | | | | | | | |
| none | 2 | | | | | | | | | | |
| "Standard Node" Enter the station number of the standard PLC. | ✓ | ✓ | ✗ | | | | | | | | |

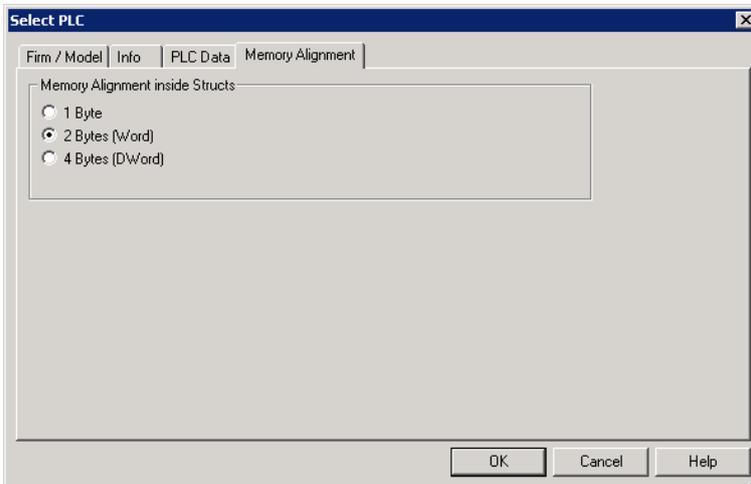

4 Creating GALILEO Projects

| Communication | RTU | MPB | TCP |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|-----|-----|
| <p>"Address offset"</p> <p>In compliance with the Modbus RTU Specification, the start address of a data packet is transferred minus 1 (address offset) (GALILEO address 5 = Protocol address 4). Select 0 for this parameter if this is not defined in your PLC.</p> | ✓ | ✓ | ✓ |
| <p>"Parity"</p> <p>Set here the parity according to your PLC. With Modbus RTU the default setting is 0 (even parity).</p> | ✓ | ✓ | ✗ |
| <p>"Little/Big Endian Mode"</p> <p>This parameter defines how the data is organised in the protocol. Further information on this is provided in the section "Data interpreter".</p> | ✓ | ✓ | ✓ |
| <p>"IP address or network name"</p> <p>The IP address or network name of your PLC. Further information on the use of network names is provided in the Windows CE documentation.</p> | ✗ | ✗ | ✓ |
| <p>"Port number"</p> <p>This sets the port number via which your PLC is to communicate. (default 502)</p> | ✗ | ✗ | ✓ |

MEMORY ALIGNMENT

The memory alignment determines the granularity (8, 16 or 32 bit) of the data combined within structures.

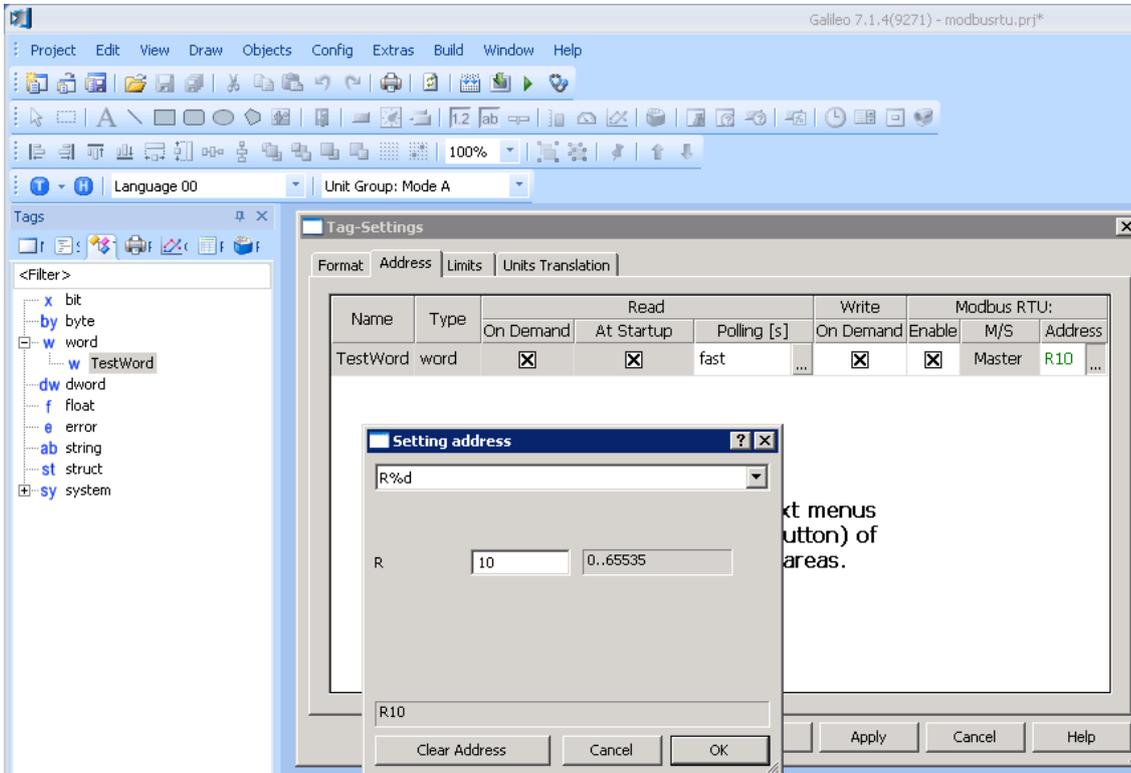

The following table shows how the memory alignment of structures and the set granularity define the data image and the data volume in the PLC.

| Data byte | GALILEO structure | Memory alignment | | |
|-----------|-------------------|------------------|---------------|----------------|
| | | 1 Byte | 2 Byte (Word) | 4 Byte (DWord) |
| 00 | Byte_a | Byte_a | Byte_a | Byte_a |
| 01 | Word_a | Word_a | | |
| 02 | | | Word_a | Word_a |
| 03 | Byte_b | Byte_b | | |
| 04 | DWord | DWord | Byte_b | Byte_b |
| 05 | | | | |
| 06 | | | | |
| 07 | | | DWord | |
| 08 | Byte_c | Byte_c | | DWord |
| 09 | Word_b | Word_b | Byte_c | |
| 10 | | | Byte_c | |
| 11 | | | | |
| 12 | | | Word_b | Byte_c |
| 13 | | | | |
| 14 | | | | Word_b |
| 15 | | | | |

4 Creating GALILEO Projects

4.1 DEFINING TAG VARIABLES

Now create a "TestWord" tag variable in GALILEO as shown in the following example and assign this tag with an address in your PLC.

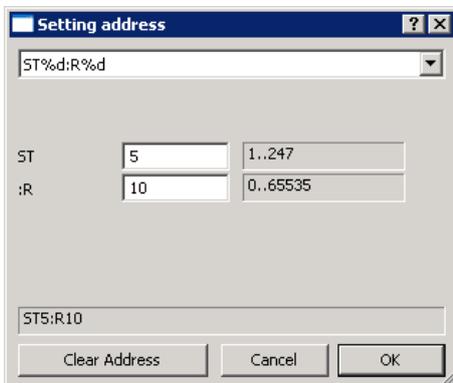

The GALILEO tag "TestWord" in the example is referenced to address R10.

Note:

The "Standard Node" (section "Creating GALILEO Projects") is addressed if no station number is entered for the PLC.

The station number of the PLC can also be defined explicitly for every tag as follows.

The addressing in GALILEO requires each memory location of types "R" and "RI" to contain a 16-bit value.

| PLC address | Byte (8-bit value) | Word (16-bit value) | DWord (32-bit value) |
|-------------|---------------------------|---------------------------|----------------------------|
| R10.0 | Byte[0] Bit 00..07 | Word[0] Bit 00..07 | DWord[0] Bit 00..07 |
| R10.8 | Byte[1] Bit 00..07 | Word[0] Bit 08..15 | DWord[0] Bit 08..15 |
| R11.0 | Byte[2] Bit 00..07 | Word[1] Bit 00..07 | DWord[0] Bit 16..23 |
| R11.8 | Byte[3] Bit 00..07 | Word[1] Bit 08..15 | DWord[0] Bit 24..31 |
| R12.0 | Byte[4] Bit 00..07 | Word[2] Bit 00..07 | DWord[1] Bit 00..07 |
| R12.8 | Byte[5] Bit 00..07 | Word[2] Bit 08..15 | DWord[1] Bit 08..15 |
| R13.0 | Byte[6] Bit 00..07 | Word[3] Bit 00..07 | DWord[1] Bit 16..23 |
| R13.8 | Byte[7] Bit 00..07 | Word[3] Bit 08..15 | DWord[1] Bit 24..31 |

Table of examples for linear data types with start address R10

With types "M" and "MI", on the other hand, each memory location is only 1 bit.

| PLC address | Byte (8-bit value) | Word (16-bit value) | DWord (32-bit value) |
|-------------|---------------------------|---------------------------|----------------------------|
| M17..24 | Byte[0] Bit 00..07 | Word[0] Bit 00..07 | DWord[0] Bit 00..07 |
| M25..32 | Byte[1] Bit 00..07 | Word[0] Bit 08..15 | DWord[0] Bit 08..15 |
| M33..40 | Byte[2] Bit 00..07 | Word[1] Bit 00..07 | DWord[0] Bit 16..23 |
| M41..48 | Byte[3] Bit 00..07 | Word[1] Bit 08..15 | DWord[0] Bit 24..31 |
| M49..56 | Byte[4] Bit 00..07 | Word[2] Bit 00..07 | DWord[1] Bit 00..07 |
| M57..64 | Byte[5] Bit 00..07 | Word[2] Bit 08..15 | DWord[1] Bit 08..15 |
| M65..72 | Byte[6] Bit 00..07 | Word[3] Bit 00..07 | DWord[1] Bit 16..23 |
| M73..80 | Byte[7] Bit 00..07 | Word[3] Bit 08..15 | DWord[1] Bit 24..31 |

Table of examples for linear data types with start address R10

4 Creating GALILEO Projects

4.2 CREATING THE TEST SCREEN

Now create a new screen and position a value entry element that is assigned with "TestWord".

The project is now completed and communication with the PLC can now be tested.

5 TESTING THE GALILEO PROJECT

As the Modbus RTU protocol is available both for the SYSTEM PORT and for the MPB1(2)-TP, you can test your project directly on the PC.

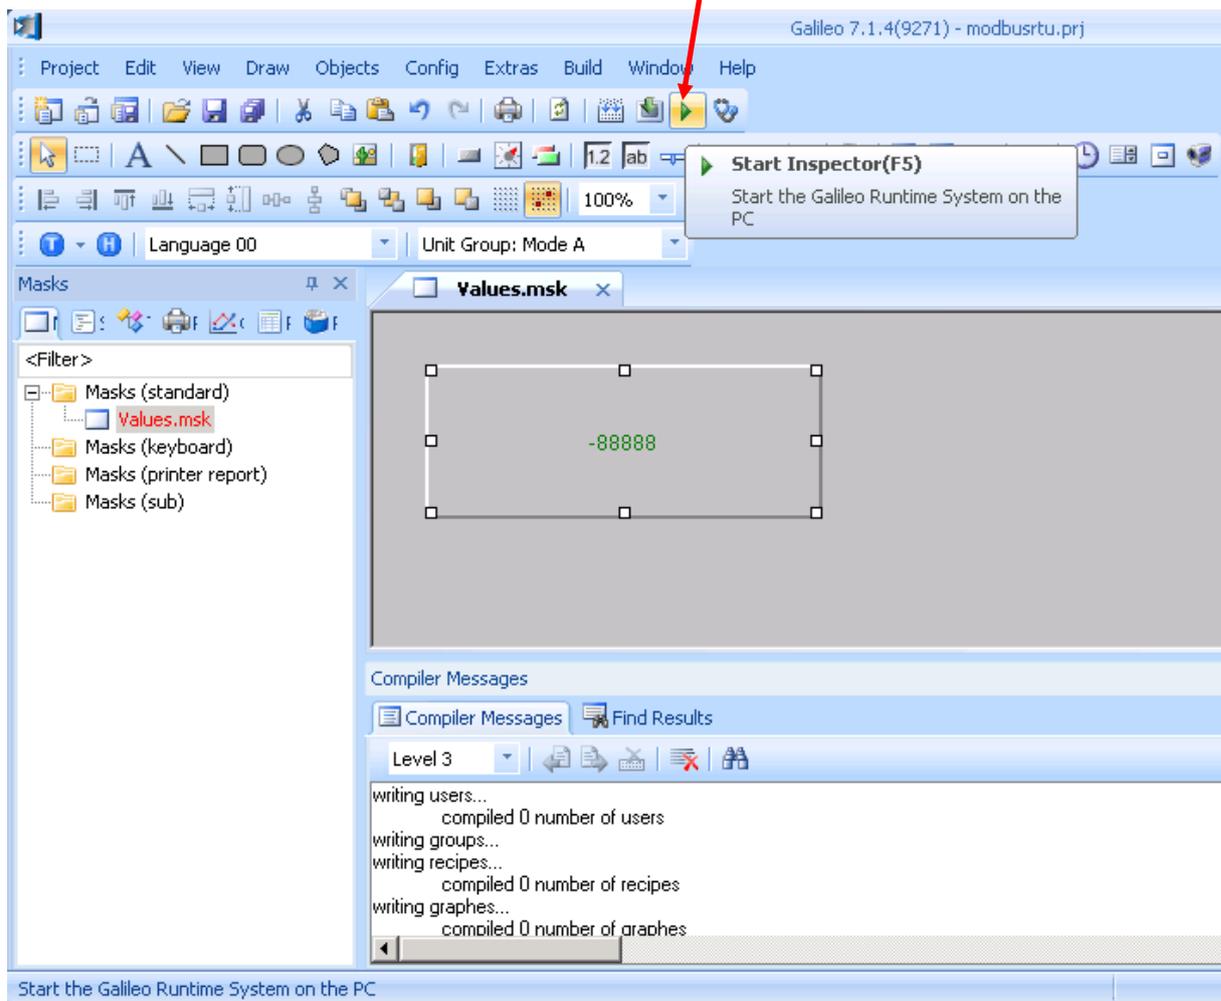

Requirements:

The interface of the PLC supports the RS232 standard and you have selected "Modbus RTU (OnBoard)" in the PLC selection dialog!

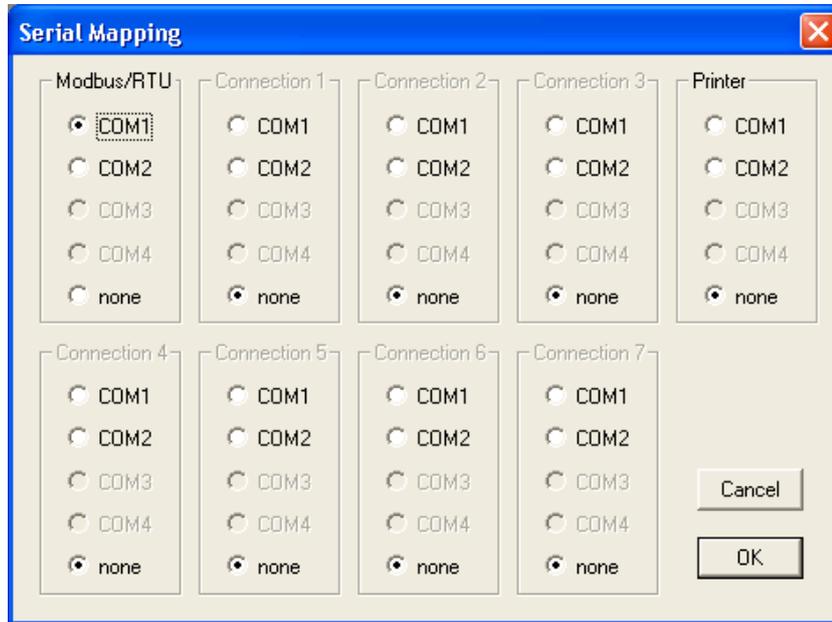

For the connection between the PC and PLC use a communication cable as described in the section "SYSTEM PORT and PC COM(x) variants".

Now compile the project that you have created in the section "Creating GALILEO Projects" and start the **GALILEO Project Inspector (GPI)** by clicking the "Start Inspector – button".

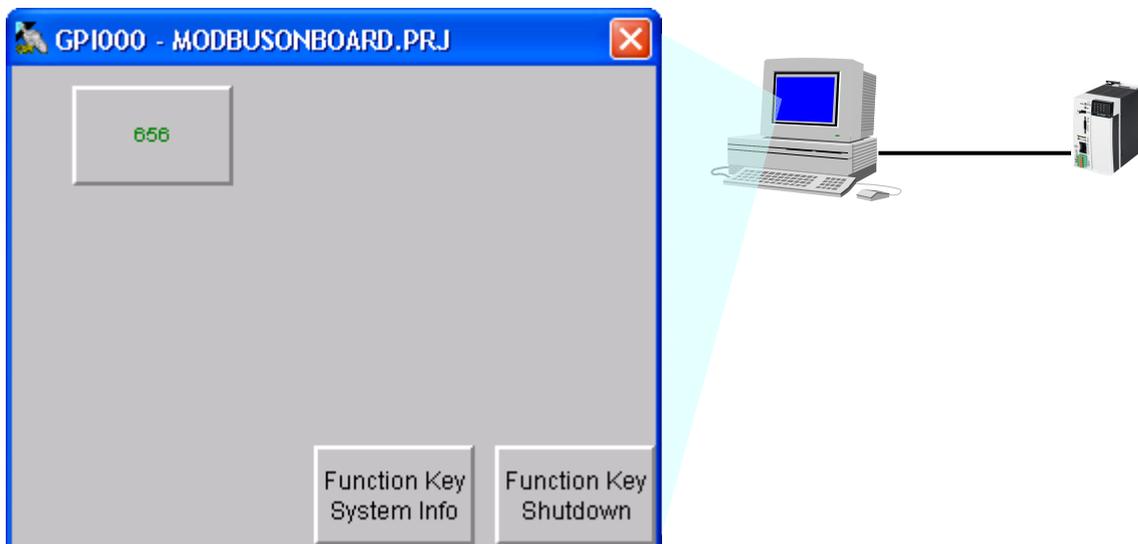

5 Testing the GALILEO Project

The first time the GPI is started, you must specify the COM interface of the PC that is connected with the PLC.

The GPI will then establish an active connection to the PLC and you can then set the "TestWord" tag as required.

Close the GPI by pressing "Q" or a configured "Shutdown" function and start this again. If the last entered value is shown again, everything has been configured correctly.

You can now transfer the project to your MICRO PANEL and then start it again. Refer to the GALILEO documentation for further information.

Note:

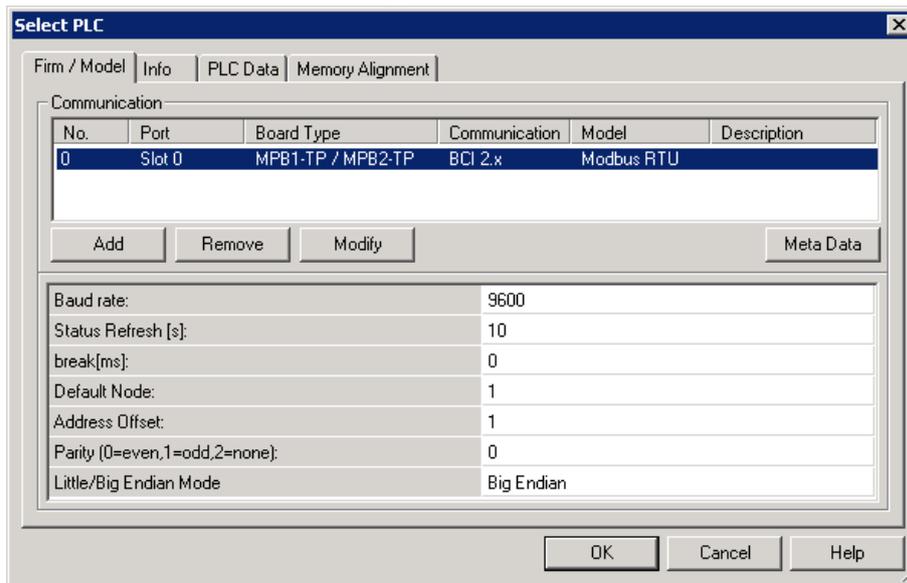

The plug and pin assignment of the SYSTEM PORT on the MICRO PANEL is the same as the standard RS232 PC interface. In this case, you can use the same communication cable!

5.1 TEST WITH MPB1(2)-TP COMMUNICATION CARD

Prepare a cable beforehand that fits the physical interface of your PLC, as described in "Cable Assembly".

The physical interface (COM PORT) of the MPB1(2)-TP communication card can be set with jumpers. For more information on this refer to documentation of the communication card (section "General").

Ensure that the "Modbus RTU" type has been selected in the Select PLC dialog.

Now transfer the compiled project to the MICRO PANEL. The driver for the MPB1(2)-TP communication card is also transferred with it.

You then have to program this driver once on the communication card. Refer to the GALILEO documentation on how to do this.

Note:

Ensure that the STD/ALT jumper of the communication card is set to position ALT.

After successfully completing programming, start the MICRO PANEL again. Active communication with the PLC is established after the device startup.

6 MOVISTO

A dedicated communications driver was implemented for the Movisto controller. Select 'Movisto' instead of 'Modbus RTU' in GALILEO. The programming is identical to the standard Modbus drivers.

This communications driver does not immediately generate an error message on the absence of a response telegram. If there is no response after multiple retries, an error is reported.

We do not recommend using this communications driver. The sporadic absence of response is an indication for serious problems in the controller. If so, consult the manufacturer of the controller.

7 OLDER MODBUS RTU DRIVERS

If you have previously used an older Modbus RTU driver, the following table shows how to set the parameters for the conversion.

| Parameters of new drivers | Modbus RTU (PTP)... | Modbus RTU (MP)... |
|----------------------------|-----------------------|--------------------------|
| Status Refresh [s] | Ditto | Ditto |
| Pause [ms] | 50 | Ditto |
| Baud rate | 9600 | Ditto |
| Standard Node | = PLC station no. | Optional (section "4.1") |
| Address offset | 1 | 1 |
| Parity | 0 | Ditto |
| Little/Big Endian Mode | Little Endian Twisted | Little Endian Twisted |
| Stopbits (0=default, 1, 2) | 0 | 0 |

Ditto = Setting as per previous driver

Note:

In both cases you must load the new driver (MODB32.BIN) onto the communication card. If you have previously used "Modbus RTU (PTP) ...", you must also move the STD/ALT jumper to ALT.

8 HIMA

8 HIMA

The general requirements described in the previous sections apply here also. The following only describes specific instructions and settings applicable to the HIMatrix and H51/H41 and A1 PLC systems from HIMA.

Eaton Automation offers no support for the ELOP programming environment. Please send your enquiries directly to the manufacturer.

8.1 CABLE ASSEMBLY

DSUB 9pole male

DSUB 9pole male

| MPB1/MPB2 COM PORT | | RS485 | HIMatrix FB1 | |
|-----------------------|--------|-------|-----------------|------|
| PIN | SIG | | SIG | PIN |
| 3 | A | | A | 3 |
| 7 | B | | B | 8 |
| 5 | 0V | | 0V | 5 |
| CASE | SHIELD | | SHIELD | CASE |

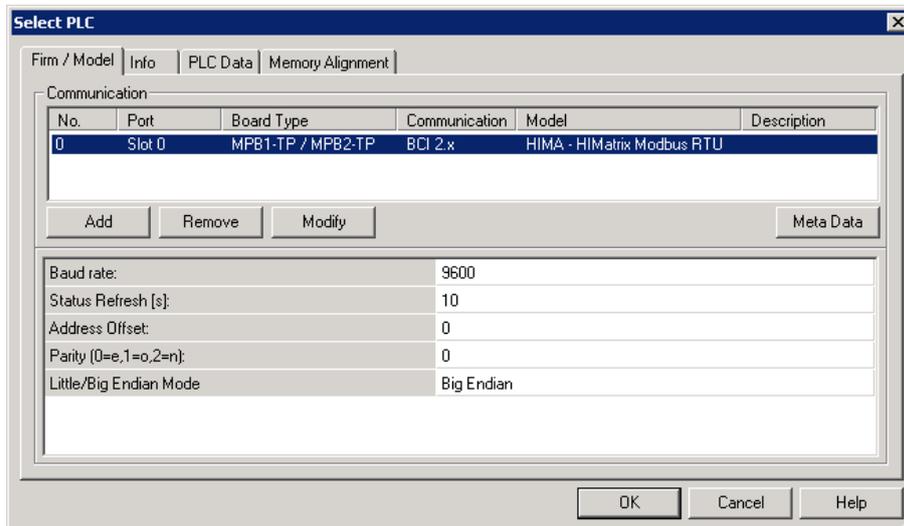

| MPB1/MPB2 COM PORT | | RS485 | A1 SIO1 | |
|-----------------------|--------|-------|------------|------|
| PIN | SIG | | SIG | PIN |
| 3 | A | | A | 3 |
| 7 | B | | B | 8 |
| 5 | 0V | | 0V | 5 |
| CASE | SHIELD | | SHIELD | CASE |

| MPB1/MPB2 COM PORT | | RS485 | H51/H41 F865x | |

| 3 | A | | A | 3 |
| 7 | B | | B | 8 |
| 5 | 0V | | 0V | 5 |
| CASE | SHIELD | | SHIELD | CASE |

8.2 GALILEO PLC SELECTION

Select one of the following types in GALILEO under "Select PLC":

- ➔ MPB1(2)-TP : "HIMA – HIMatrix Modbus RTU"
- ➔ MPB1(2)-TP : "HIMA – H51/H41/A1"

Ensure that the baud rate and parity match the setting in the PLC.

Note:

Set the "Address offset" parameter to 0 regardless of the PLC type (see also section "Creating GALILEO Projects").

8 HIMA

8.3 ADDRESSING

For Modbus RTU communication with the HIMA PLCs, the MICRO PANELs support the following function codes and associated data areas.

H51/H41/A1

| Modbus register | GALILEO | Function code | | Data type | Granularity |
|-----------------|---------|---------------|-------|-----------|-------------|
| | | Read | Write | | |
| Coils | BO | 0x01 | 0x0F | Bit | 16 Bit |
| Discrete inputs | BI | 0x01 | 0x0F | Bit | 16 Bit |
| Input registers | WI | 0x03 | 0x10 | Word | 16 Bit |
| Registers | WO | 0x03 | 0x10 | Word | 16 Bit |

| GALILEO | | Modbus | | H51/H41/A1 | | Modbus | | GALILEO |
|---------|---|--------|---|------------|---|--------|---|---------|
| BO | → | 0x0F | → | BOOL | → | 0x01 | → | BO |
| BI | → | 0x0F | → | | → | 0x01 | → | BI |
| WO | → | 0x10 | → | WORD | → | 0x03 | → | WO |
| WI | → | 0x10 | → | | → | 0x03 | → | WI |

HIMatrix

| Modbus register | GALILEO | Function code | | Data type | Granularity |
|-----------------|---------|---------------|-------|-----------|-------------|
| | | Read | Write | | |
| Coils | BO | | 0x0F | Bit | 16 Bit |
| Discrete inputs | BI | 0x02 | - | Bit | 16 Bit |
| Input registers | WI | 0x04 | - | Word | 16 Bit |
| Registers | WO | | 0x10 | Word | 16 Bit |

| GALILEO | | Modbus | | HIMatrix | | Modbus | | GALILEO |
|---------|---|--------|---|----------|---|--------|---|---------|
| BO | → | 0x0F | → | BOOL | → | 0x02 | → | BI |
| WO | → | 0x10 | → | WORD | → | 0x03 | → | WI |

Note:

The signal allocation must be completed in the ELOP programming environment beforehand for active communication with the PLC. For this ensure that coils (BIT/BOOL) are always available in multiples of 16.

Refer to the documentation of ELOP or the PLC for further information.

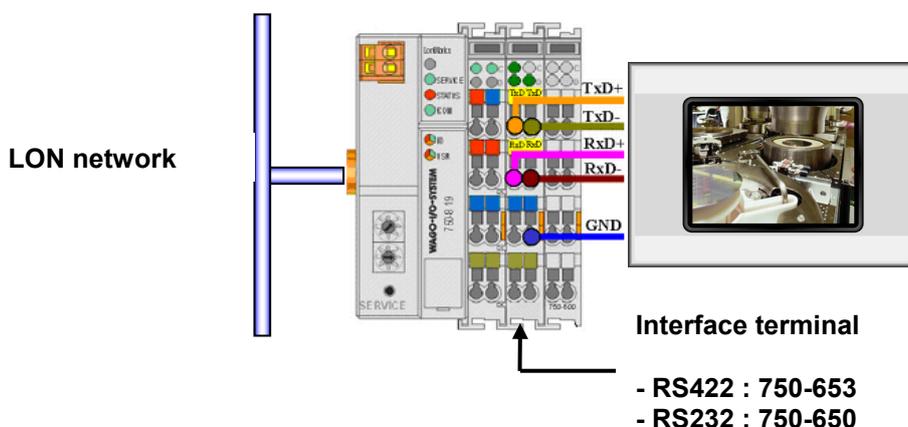

9 WAGO I/O SYSTEM

The general requirements described in the previous sections apply here also. The following only describes specific instructions and settings for WAGO I/O System.

Eaton Automation offers no support for the WAGO programming environment. Please send your enquiries directly to the manufacturer.

9.1 OPERATING PRINCIPLE

The type of coupling described here is only supported by programmable WAGO fieldbus controllers such as the LON coupler 750-819.

9.2 CABLE ASSEMBLY

DSUB 9pole male

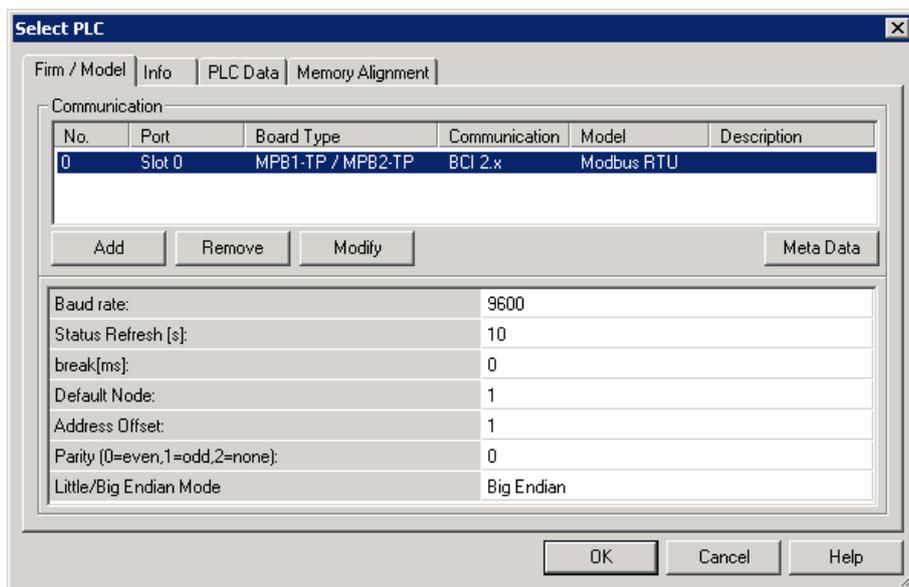

| MPB1/MPB2 COM PORT | | RS422 | WAGO modules 750-653 | |

9.3 GALILEO PLC SELECTION

Select one of the following types in GALILEO under "Select PLC":

- MPB1(2)-TP : "Modbus RTU"
- SYSTEM PORT : "Modbus RTU (OnBoard)"

Set the parameters as shown in the figure. Follow the instruction on "Standard Node" in the section "Defining tag variables".

Note:

The "Pause[ms]" parameter should be set higher (+10ms) than the timeout set on the WAGO function block (TERMINAL_MODBUSSLAVE_RTU).

For further information on this refer to the WAGO documentation "Connecting a Eaton Automation Touch Panel to a WAGO Controller 750-8xx".

9.4 ADDRESSING

For Modbus RTU communication with the WAGO controllers, the MICRO PANELs support the following function codes and associated data areas.

| Modbus register | GALILEO | Function code | | Data type | Granularity |
|-----------------|---------|---------------|-------|-----------|-------------|
| | | Read | Write | | |
| Coils | M | 0x01 | 0x0F | Bit | 16 Bit |
| Registers | R | 0x03 | 0x10 | Word | 16 Bit |

| GALILEO | | Modbus | | WAGO Controller | | Modbus | | GALILEO |
|---------|---|--------|---|-------------------|---|--------|---|---------|
| M | → | 0x0F | → | aDATA[BIT_OFFSET] | → | 0x01 | → | M |
| R | → | 0x10 | → | aDATA[0] | → | 0x03 | → | R |

Note:
 The **TERMINAL_MODBUSSLAVE_RTU** function block from WAGO defines an **ARRAY** for up to 256 Modbus registers (aDATA).
 The **BIT_OFFSET** parameter is used to define from which index the coils are stored in the **ARRAY**.

10 ERROR MESSAGES

The following system messages may be generated if communication is faulty:

| System message (Status) | Possible cause |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| "..... CONNECTION" "..... CABLE" | There is no bus connection or the connection cable was incorrectly prepared. |
| "..... TIMEOUT" | The PLC is sending an incomplete data stream. |
| "..... ADDRESS" "..... ILLEGAL DATA ADDRESS" | The requested address is not available in the PLC. |
| "..... STATION" | The response was not generated by the addressed PLC. |
| "..... PROTOCOL" "..... ILLEGAL FUNCTION" | The response of the PLC does not comply with the Modbus RTU Specification or the Modbus function (function code) is not available. |
| "..... CHECKSUM?" | The checksum of the data packet is not correct. |
